· DEMO SESSION 4 · MILESTONE 4

Project Review 4

Present your full project, end to end, and receive detailed feedback before final grading.

WELCOME BACK

Quick Recap of Module 4

1. Linear & multiple regression, and prediction metrics
2. Logistic Regression, KNN, and classification metrics
3. Decision trees, Random Forests, and feature importance
4. K-Means clustering and cluster interpretation
5. Cross validation, learning curves, and error analysis
6. Fair model comparison and interpretation

TODAY'S GOAL

There is no new coding today. Present your complete project and get detailed, section-by-section feedback before Demo Day .

Why This Milestone Matters

◎ **DEFINITION**

This is your last chance to improve before the project is graded for real.

1. Every earlier milestone gets reviewed together, as one connected project, for the first time
2. Detailed, section-by-section feedback gives you concrete notes to act on
3. What you fix between today and Demo Day directly shapes your final grade

What Happens in This Demo Session

◎ **DEFINITION**

Each team presents their full Machine Learning model, and the instructor reviews it section by section.

1. Your team walks through the complete project, from problem to results
2. The instructor gives written feedback on each individual section, not just one overall score
3. You leave with a specific, actionable list of what to improve before Demo Day

PART 2 · WHAT YOU PRESENT

Machine Learning

1. Which models you selected, and why

2. How you trained, evaluated, and compared them

2. Comparison between different models Accuracy and why you choose final model.

Results

1. Your model's predictions and final performance

2. Challenges you ran into, and improvements you're planning

PART 3 · HOW YOU'RE EVALUATED

What Feedback Focuses On

1. Is your project technically correct, end to end?
2. Is your work documented clearly enough for someone else to follow?
3. Are your decisions insightful and genuinely justified?
4. Is your presentation clear about process, results, and business relevance?

The Four Grading Criteria

Criterion	What's Evaluated
Technical Correctness (40%)	Code runs, logic is sound, methods are applied appropriately
Documentation & Clarity (20%)	Notebook is well-commented, structured, and reproducible
Insight & Justification (25%)	Decisions — cleaning, features, model choice — are explained and justified
Presentation (15%)	Clear communication of process, results, and business relevance

JUST IN CASE

Common Milestone 4 Mistakes

Mistake	What Happens
Presenting sections in isolation	The story loses its thread — each section should connect to the last
Reporting only the best model's score	Reviewers want to see the comparison, not just the winner
Skipping challenges and limitations	Every real project has them — naming yours shows honest, mature work

What Good Feedback Sounds Like

Instead Of	Listen For
"Good project overall."	"Your Data Preparation section needs one more sentence justifying the encoding choice."
"Nice results."	"Show the cross-validated score alongside the single test score for full transparency."
"Keep improving."	"Name one specific limitation of your final model before Demo Day."

QUICK RECAP

What a Strong Milestone 4 Looks Like

1. A clear, connected story from problem to results
2. Every decision explained and justified
3. A fair, cross-validated model comparison
4. Honest challenges and planned improvements
5. Clean, well-documented notebooks
6. A team ready to defend every choice under questions

BEFORE Demo Day

Your To-Do List

1. **Act on every piece of written feedback**

   Go section by section and address each specific note you received today.

2. **Polish your final presentation**

   Refine your slides to follow the required structure for Demo Day.

3. **Rehearse your full walkthrough**

   Practice presenting your entire project clearly within your time limit.
